

Economic Development and Health Outcomes: The Relationship Between GDP per Capita and Life Expectancy in 2020

Reported by Dr NADJINGAR DOUMDE Freddy

1. GDP per Capita Distribution (2020)

The histogram (figure 1) shows that GDP per capita is highly uneven across countries. Most countries are concentrated in the lower- and middle-income ranges, while only a small number of countries have very high GDP per capita values. This creates a right-skewed distribution, indicating large global income inequality. This pattern suggests that wealth is concentrated among relatively few high-income economies.

2. Life Expectancy Distribution (2020)

The histogram indicates (figure 2) that most countries have life expectancy values clustered between approximately 65 and 80 years. Compared with GDP per capita, the distribution is more balanced and less skewed. Only a few countries fall at very low life expectancy levels. This suggests that while health outcomes differ across countries, the variation is smaller than the variation in economic wealth.

Figure 2. Distribution of Life Expectancy Across Countries in 2020

3. GDP per Capita vs Life Expectancy Scatterplot (2020)

The scatterplot shows a positive relationship between GDP per capita and life expectancy. Countries with higher income levels generally tend to have longer life expectancy. This suggests that economic development is associated with better living conditions, healthcare access, nutrition, and public services that contribute to improved health outcomes. However, the relationship is not perfectly linear. At higher income levels, increases in GDP per capita produce smaller improvements in life expectancy, indicating diminishing returns once countries reach advanced levels of development.

4. My reflection

What was easy?

I think it was easy when we wrote a clear and correct prompt. Good prompts made it easier to get accurate results and complete the analysis effectively.

What was difficult?

The difficult part was understanding and interpreting the analysis without having a strong background in data analysis. Some concepts and results required extra explanation to fully understand.

What was surprising? What did you learn?

The results were impressive and surprising. I learned that AI can help perform data analysis efficiently and create visualizations and interpretations quickly. I also learned how to use AI tools to support analytical work and reporting.
